

BRODHEAD WATERSHED ASSOCIATION

2015 FECAL COLIFORM STUDIES

- Each value represents the geometric mean concentration of fecal coliform bacteria from five water samples taken within a 30-day period.
- The values are in units of colony forming units (CFU) per 100mL of water.
- Sites were sampled for **one** 30-day period during the summer of 2015.
- During that period, if the coliform concentration exceeds the acceptable level, that stream segment is considered impaired for recreation use (ex. Swimming)

<200 CFU Acceptable Level

>200 CFU Unacceptable Level

>200 CFU Impaired
